### Ashrae Cooling And Heating Load

The ASHRAE Heat Balance Method states that the " sum of all space instantaneous heat gains at any given time does not necessarily (or even frequently) equal the cooling load for the space at that same time ". Figure 2 attempts to convey this phenomenon by demonstrating the time delay associated with the 'Gains vs Loads' discussion.

The total building cooling load consists of heat transferred through the building envelope (walls, roof, floor, windows, doors etc.) and heat generated by occupants, equipment, and lights. The load due to heat transfer through the envelope is called as external load, while all other loads are called as internal loads.
