Although digital imaging systems are high tech, a conventional x-ray machine is still needed to expose the image, and the position of the image receptor (sensor or phosphor storage plate [PSP]) in the mouth is identical to positioning with film. In addition, strict infection control measures must be used because the sensors and PSPs are reused time and again.

The progress of the entire trituration process which takes place in an oscillating dental amalgam capsule was recorded using high speed motion picture cinematography. This technique has permitted, for the first time, unambiguous observations to be made of the mechanisms responsible for trituration.
