And one of the functions that RNA plays is to be that messenger, that messenger between a certain section of DNA and kind of what goes on outside of the nucleus, so that that can be translated into an actual protein. So the step that you go from DNA to mRNA, messenger RNA, is called transcription. Let me write that down.

Most people think of cancer as a disease of disorderly DNA. Changes, or mutations, in the sequence of DNA alter the function of the proteins made from that DNA, leading to uncontrolled cell division. But between DNA and proteins is another layer of information, called messenger RNA (mRNA), which serves as a crucial link between the two.

### In a Twist, Scientists Find Cancer Drivers Hiding in RNA ...

DNA can form into double-stranded structures, such as during translation, when mRNA and tRNA molecules pair. DNA polymers are also much longer than RNA polymers; the 2.3m long human genome consists of 46 chromosomes, each of which is a single, long DNA molecule. RNA molecules, by comparison, are much shorter 4.

The ends of DNA strands are called the 5' (five prime) and 3' (three prime) ends. The 5' end has a terminal phosphate group and the 3' end a terminal hydroxyl group. One of the major structural differences between DNA and RNA is the sugar, with the 2-deoxyribose in DNA being replaced by ribose in RNA. The structure of DNA

The RNA world is a hypothetical stage in the evolutionary history of life on Earth, in which self-replicating RNA molecules proliferated before the evolution of DNA and proteins.The term also refers to the hypothesis that posits the existence of this stage. Alexander Rich first proposed the concept of the RNA world in 1962, and Walter Gilbert coined the term in 1986.
