### Johnson Cook Aluminum

This research focuses on the study of the effects of processing conditions on the Johnson-Cook material model parameters for orthogonal machining of aluminum (Al 6061-T6) alloy. Two sets of parameters of Johnson-Cook material model describing material behavior of Al 6061-T6 were investigated by comparing cutting forces and chip morphology.

The stress-strain data of 7050-T7451 aluminum alloy have been obtained by means of the uniaxial tensile tests at different strain rates ( $10^{-3} \text{ s}^{-1}$ ,  $800 \text{ s}^{-1}$ ,  $1900 \text{ s}^{-1}$  and  $2900 \text{ s}^{-1}$ ). A modified Johnson-Cook model was proposed by incorporating changing strain rate hardening coefficients with strain rate and strain.

Abstract Johnson-Cook failure strain parameters were developed for Ti-6Al-4V and 2024-T3 aluminum. The titanium parameters, obtained from simulations of split Hopkinson bar tensile tests, were successfully used to simulate blade fragment impact tests on 0.602", 0.250", and 0.737" thick titanium targets.

The objective of this project was to evaluate the use of the Johnson-Cook strength and failure models in an adiabatic finite element model to simulate the puncture of 7075- T651 aluminum plates that were studied as part of an ASC L2 milestone by Corona et al (2012). The Johnson-Cook model parameters were determined from material test data.
