Bacterial protein toxins, microbial exoproducts, or bacterial protein toxins with microbial exoproducts combined can actually interfere with each pathway of the innate immune system and either initiate or down-regulate inflammatory responses in the course of infection (Merrell and Falkow, 2004; Moese et al., 2002; Vergnolle et al., 2001).

Microbial Toxins - an overview | ScienceDirect Topics

This volume provides an overview of microbial toxins from diverse bacterial and fungal origins. These molecules, produced by various species and consisting of protein or small organic molecules, can play a pivotal role in pathogenesis of plants, animals, and humans that in turn can lead to the survival/dissemination of the host microbe.

Microbial Toxins | SpringerLink

Microbial toxins are toxins produced by micro-organisms, including bacteria and fungi. Microbial toxins promote infection and disease by directly damaging host tissues and by disabling the immune system. Some bacterial toxins, such as Botulinum neurotoxins, are the most potent natural toxins known. However, microbial toxins also have important uses in medical science and research.

(PDF) Bacterial Toxins and Their Modes of Action: A Review ...

Many bacterial toxins consist of two components, A and B subunits, and are called AB toxins. Subunit B is involved in binding to the target, a specific receptor and subunit A performs the catalytic action on a substrate. Diphtheria toxin and botulinum toxins are AB toxins which contain a translocation component in the binding subunit.

Bacterial toxins are by-products produced by pathogenic microbes that have taken up residence in the body. Bacterium can enter a host by various means, such as consuming contaminated food or water. Bacteria can also be introduced through mucous membranes, either by direct contact with the source or as a consequence of breathing in air-borne bacteria.

What are Bacterial Toxins? (with pictures)

1. microorganism produces toxin that disrupts cell membrane. i.e. anaerobic clostridia causing gas gangrene 2. microbe multiplies within host --> lysis from the inside i.e. rickettsiae causing Rocky motion spotted fever 3. microbes multiply within host cell but are eradicated by cytotoxic lymphocytes or NK cells. i.e. mycobacteria

Bacterial toxins are virulence factors that manipulate host cell functions and take over the control of vital processes of living organisms to favor microbial infection. Some toxins directly target innate immune cells, thereby annihilating a major branch of the host immune response. In this review we will focus on bacterial toxins that act from the extracellular milieu and hinder the function ...
